Suggested tightening torque for assembly screws.

Resistance tests	AXIAL STRESS	RADIAL STRESS	90° ANGLED STRESS
Description	Static load max limit Sa [N]	Static load max limit Sr [N]	Static load max limit S90 [N]
CFSQ.60-SH-6	2100	2800	1300

Suggested tightening torque for assembly screws. For CFSQ hinges with built-in safety switch, the reference value supplied is the max limit static load (Sa, Sr, S90), since these hinges can be used as safety devices. Above this value, the material may break, thus prejudicing the hinge functionality. Obviously a suitable factor, according to the importance and safety level of the specific application, must be applied to this value. The load values shown in the tables of the different hinges are the result of tests carried out in our laboratories under controlled temperature and humidity (23°C-50% R.H.), under given conditions of use and for a limited period of time.

Material

Self-extinguish high-rigidity SUPER-technopolymer. Resistant to solvents, oils, greases and other chemical agents.

Colour

Black, matte finish.

Rotation pin

AISI 303 stainless steel.

Standard executions

Assembly by means of pass-through holes for M6 countersunk-head screws UNI 5933, DIN 7991.

- C-A-D: axial connector, microswitch on the right.
- C-A-S: axial connector, microswitch on the left.
- C-B-D: rear connector, microswitch on the right.
- C-B-S: rear connector, microswitch on the left.
- F-A-D: axial cable, 2 or 5 m length, microswitch on the right.
- F-A-S: axial cable, 2 or 5 m length, microswitch on the left.
- F-B-D: rear cable, 2 or 5 m length, microswitch on the right.
- F-B-S: rear cable, 2 or 5 m length, microswitch on the left.

Cable type: UL/CSA STYLE 2587 3 X AWG 22.

Features and applications

- The hinge with built-in switch (ELESA patent) is a safety device because in case of accidental opening of doors, machine protections, or safety doors on machines and production equipment, it automatically breaks off the power supply hence protecting the operators.
- This hinge can be subject to frequent washing cycles and can be used in any situation or environment where a special attention to cleaning and hygiene is requested, thanks to the IP67 protection class and the use of stainless steel elements for closing the hinge body.
- Switch equipped with two contacts: one NC contact and one change-over NO contact, form C, see IEC EN 60947-5-1 standard.
- Switch set with positive opening (in compliance with IEC EN 60947-5-1 standard, K attachment): the contacts break off for the direct movement of an actuator, onto which the working force is applied through non elastic elements.
- Quick release switch: the stroke speed of the contact-holder slider does not depend on the working speed.
- Easy to assemble: the built-in safety switch is integrated into a single body with the hinge, thus offering a very easy and fast assembly. This is a great advantage in comparison with some traditional systems which still require to set up separately a hinge and a safety switch connected by a special pin to replace the standard pin of the hinge.
- Universal usage: CFSQ hinges can be assembled on the most common aluminium profiles.

Rotation angle (approximate value)

Max 190° (-10° and +180° being 0° the condition where the two interconnected surfaces are on the same plane fig.1). The switching angle (see Built-in safety switch functioning and maintenance) is guaranteed from this position. The hinge must not be stressed by any negative angle of less than -10° (fig. 2). The normal use of the hinge is for positive angles only.

Accessories on request

FC-M12x1: extensions with 4 pole M12 female axial connector.

Special executions on request

Operating angle of the hinge other than from 0° to 180°, every 15°, where the system frame/door requires a special execution.

Assembly instructions

- Fit the hinge body with the built-in switch on the fixed part (frame) and the other body on the door. The distance between the axis of the hinge pin and the door must be at least 5 mm (fig.3).
- Leave the least clearance between the holes in the mounting walls and the diameter of the setscrews (Max 0.5 mm). The suggested tightening torque should not be exceeded: 5 Nm.
- The hinge must not be used as a mechanical end-stroke either for door maximum opening or for closed door. For this purpose we recommend using special mechanical stops to prevent the door from opening completely against the hinge body assembled on the frame (fig.1) or exceeding the angle where the two interconnected surfaces are on the same plane (fig.2).
- The CFSQ hinge must always be assembled with at least a second complementary **CFM** hinge (CFM.60-45- SH-6 code 425812). In case of horizontal door opening or in general of a limited weight it is possible to use one hinge only.
- The connection cables must always be protected against mechanical damages.

Cables

- Cable with M12x1 connector using the following circuit scheme.
- Normally Closed contact NC: for safety applications, according to IEC EN 60947-5-1 standard, only the NC contact (for break off) must be used leaving the NO contact unused
- Normally Open contact NO: the normally open contact can be used only if the hinge is used as status indicator (signalling) in this

case also the NC contact can be used simultaneously always as status indicator (signalling).

Category of usage	CFSQ-C.. (connector)		CFSQ-F.. (cable)
	AC15 standard IEC 60947-5-1 Typical applications: electromagnetic load controls in alternating current	48 V	4 A
	220 V	4 A	4 A
	440 V	-	3 A
DC13 standard IEC 60947-5-2 Typical applications: electromagnet controls in direct current	24 V	4 A	4 A
	127 V	0.3 A	0,3 A

In compliance with:
 IEC EN 60947-5-1:2003+A1:2009
 Low voltage control auxiliaries

Extension cable wiring
 (see accessory on request)

Cable/connector wiring

Built-in safety switch functioning and maintenance

- The operating angle (see Operating life switching angle diagram) is set at 6° (we suggest to check it according to EN294 Standard). Under normal conditions of use, when the mechanical life of the device is over, the operating angle can get up to 9°.
 - For applications with safety protection function, the hinge must be able to turn at least by 15°, equivalent to the forced opening (positive opening) of the contacts by the actuator.
 - We suggest to check the proper functioning of the CFSQ hinge prior to the start up and afterwards periodically.
- When the protection is opened the machine must stop immediately. When the protection is opened at any degrees, the machine must not be able to start.

Warnings

- The hinge with built-in safety switch must not be used in environments with frequent temperature changes which can cause condensation, in the presence of explosive or flammable gasses.
- The hinge with built-in safety switch must always be protected with a proper fuse (see table).
- The choice and use of the hinge with built-in safety switch is the responsibility of the customer who will check that the relevant application is compliant to the safety standards in force under the actual operating conditions.
- Using CFSQ hinges always implies a full knowledge of and compliance with the safety standards in force, including EN ISO 13849-1, IEC EN 60204-1, EN 1088, EN ISO 12100.
- The hinge must always be assembled and connected by qualified operators who have to check regularly its perfect functioning.

Mechanical features	Electrical features
Type of contacts: Ag 90 Ni 10	Thermic power I the Cable 10 A Connector 4A
Maximum working frequency: 1200 operation/hour	Short-circuit protection: 6A gl
Mechanical life-span (test carried in compliance with IEC EN 60947-5-1 regulation): 10^8	Seal voltage at nominal pulse: 4KV
	Insulation nominal voltage UI = 250 V
Protection class of the housing EN60529: IP67	Minimum force (torque for positive opening of contact): 0.5 Nm
Speed of operation: minimum 2° / sec., maximum 90° / sec.	Short circuit conditioned current: 1000 A
	Pollution degree: 3
	B10d = 2000000
	Tm = 20 years

Example of suitability check

- P** = weight of the door [N]
P₁ = additional extra load [N]
W = width of the door
D = distance [metres] between the centre of gravity of the door and the hinge axis. In normal conditions $D = W/2$
D₁ = distance [metres] between the hinge axis and the additional extra load application point
N = number of hinges
k = safety factor
d₁... d_n = distances (metres) of all the hinges from the hinge of reference
d_T = $d_1 + d_2 + \dots + d_n$ in case of only two hinges assembled, d_T is simply the distance between them

Conditions to be checked in order to ensure a correct functioning with two or more hinges.

$$\frac{(P+P_1)}{N} \cdot k < S_a$$

$$\frac{[(P \cdot D) + (P_1 \cdot D_1)]}{d_T} \cdot k < S_r$$

$$\frac{[(P \cdot D) + (P_1 \cdot D_1)]}{d_T} \cdot k < S_{90}$$

The technical designer must use suitable safety factors (k) according to the type of application and function of the CFSQ. hinge.

Example hinge CFSQ.60-SH-6

P = 294 N (30 Kg) **D** = 0,4 m **N** = 3
d_T = 1,5 m **d₂** = 1 m **d₁** = 0,5 m
P₁ = 196 N (20 Kg) **D₁** = 1,2 m

$$\frac{490}{3} = 163 \cdot k < 2100$$

$$\frac{[(294 \cdot 0,4) + (196 \cdot 1,2)]}{1,5} = 235,2 \cdot k < 2800$$

$$\frac{[(294 \cdot 0,4) + (196 \cdot 1,2)]}{1,5} = 235,2 \cdot k < 1300$$

The examples shown here must be considered only as explanatory, since they are not applicable to all the different applications, conditions of use, ways of assembly which can actually take place. In practice, the technical designer, after applying a suitable safety factor (k) must also test the chosen product to check its suitability. For further general technical information, refer to the guidelines.
